PROJECTS

TELA Oil Terminal Project (Vietnam & Cambodia)

IFR (Honeycomb panel)

All petroleum products stored at TELA terminals are tested to ensure contamination free and to supply the highest quality products. This guarantees that product deliveries to the customers are in superior quality. Apart from two spherical LPG storage tanks, TELA terminals have full capacities to store various petroleum products consisting of fuel oil, gas oil, gasoline and kerosene.

TELA FUEL STORAGE CENTERS

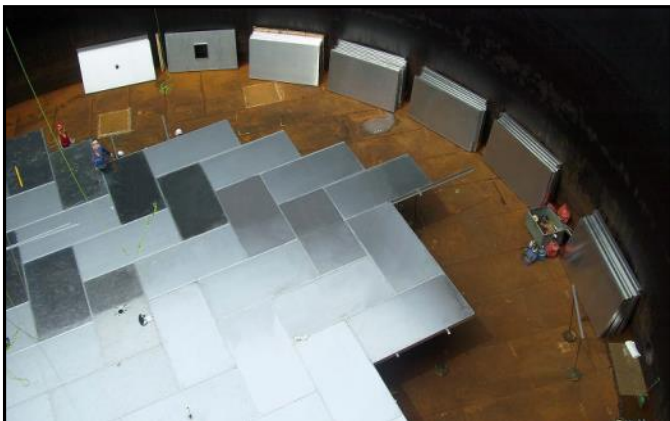

In addition to the first Fuel Storage in Phnom Penh (Tonle Sap River), TELA built an additional storage in Sihanoukville on 2 February 2004, which is situated at the largest coastal port in Cambodia.

These two main storage centers were constructed to true international standards in terms of technical, safety and environmental designs. With the terminals and modern fleet of road tankers, TELA imports and distributes good quality products to the service stations and all clients throughout Cambodia.

TELA commitment to total quality control and services are the foundation for our networks of service stations excellence serving today's demanding customers. TELA also has standard jetty with an Operation Platform that allows the ships weigh from 500 to 5000 tons to dock safely and conveniently.

The management and operations are in accordance with the international standards required by ISO organization. Since safety is the primary concern, quality and limit quantity before delivery of products to the valuable customers, all vehicles and tanks are thoroughly inspected before and after the uploading the products.

Products, its specifications and volume are also inspected and verified by the Cambodian Petroleum Authority before loading onto the tankers. - This article published from TELA POWER FOR ENERGY www.telapetroleum.com
